2019/2020 FALL SEMESTER

Digital Imaging and Interpretation

I first defined a class to use the photo and variables with different functions. I opened the first definition for resizing. I've used the extensions of the found files to get their dimensions. I applied the code I wrote to sharpen and looked at the output. I applied the code I wrote for the threshold and checked its output. I did the same to draw a dot on a white background. I checked the output. but when we look at the definition we want to run, we need to include the others in the comment line because the images are affected. whichever extension we want to use.
